

# Networking Concepts

You can refer [here](#) to gain a basic understanding of networking concepts.

## Network packet analyzer tools:

**Wireshark**- Wireshark is a network packet analyzer. A network packet analyzer presents captured packet data in as much detail as possible.

You could think of a network packet analyzer as a measuring device for examining what's happening inside a network cable, just like an electrician uses a voltmeter for examining what's happening inside an electric cable (but at a higher level, of course).

**tcpdump**- A powerful, command-line packet analyzer used primarily on Unix-like operating systems (Linux, macOS, BSD) to capture and inspect network traffic in real-time or save it to a file (.pcap or .pcapng format) for later analysis. It interacts with the user through a Command Line Interface (CLI).

## Capturing Live traffic through Wireshark

- Open kali Linux VM on your desktop.

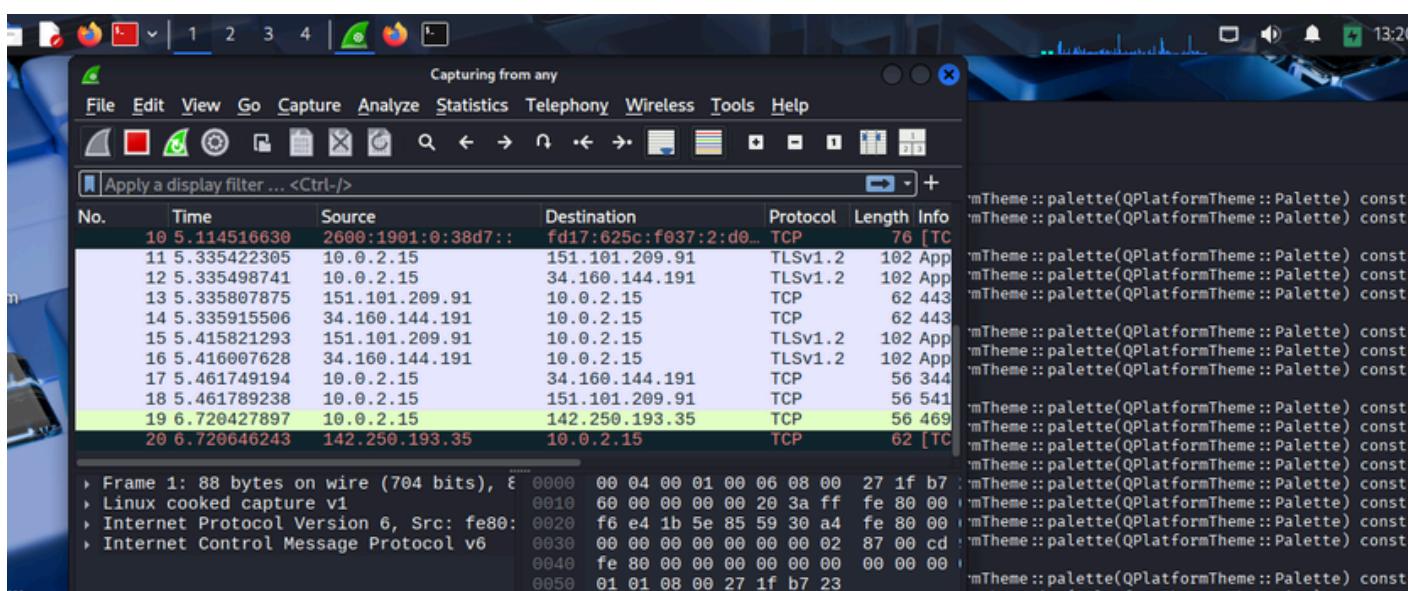

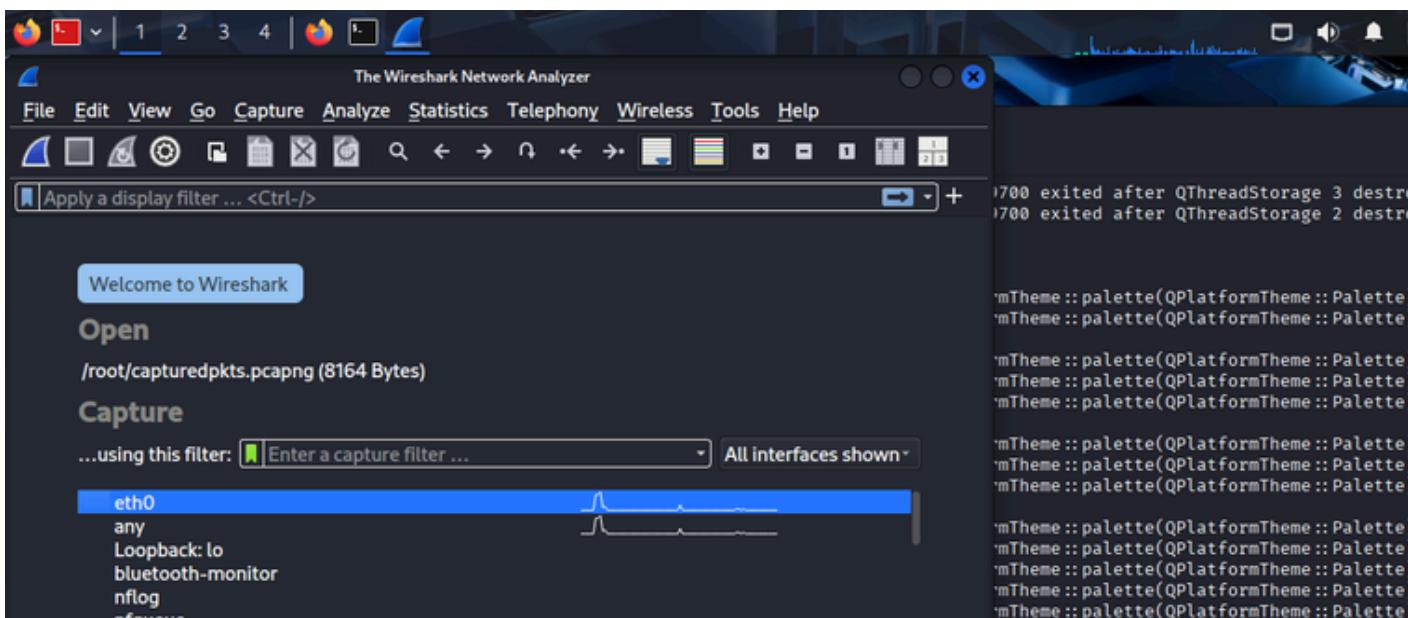

- Open the Root terminal-enter the password to authenticate.
- Type wireshark and press enter to open wireshark GUI.

```

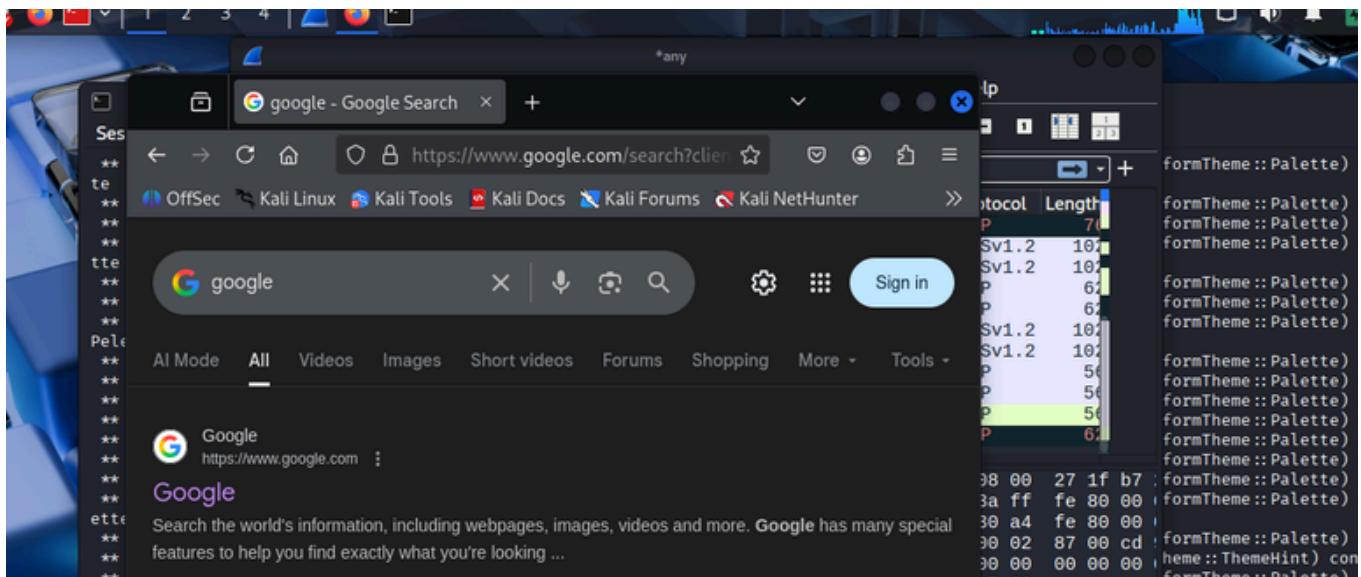

root@kali: ~
** (wireshark:6088) 12:42:30.270425 [GUI WARNING] -- QThreadStorage: Thread 0x561472d99700 exited after QThreadStorage 3 destroyed
** (wireshark:6088) 12:42:30.270434 [GUI WARNING] -- QThreadStorage: Thread 0x561472d99700 exited after QThreadStorage 2 destroyed
[root@kali: ~]
# wireshark
** (wireshark:30058) 13:18:52.899216 [GUI ECHO] -- virtual const QPalette* Qt6CTPlatformTheme::palette(QPlatformTheme::Palette) const
** (wireshark:30058) 13:18:52.899388 [GUI ECHO] -- virtual const QPalette* Qt6CTPlatformTheme::palette(QPlatformTheme::Palette) const
** (wireshark:30058) 13:18:52.899431 [GUI ECHO] -- virtual const QPalette* Qt6CTPlatformTheme::palette(QPlatformTheme::Palette) const
** (wireshark:30058) 13:18:52.899461 [GUI ECHO] -- virtual const QPalette* Qt6CTPlatformTheme::palette(QPlatformTheme::Palette) const
** (wireshark:30058) 13:18:52.899491 [GUI ECHO] -- virtual const QPalette* Qt6CTPlatformTheme::palette(QPlatformTheme::Palette) const
** (wireshark:30058) 13:18:52.899520 [GUI ECHO] -- virtual const QPalette* Qt6CTPlatformTheme::palette(QPlatformTheme::Palette) const
** (wireshark:30058) 13:18:52.899551 [GUI ECHO] -- virtual const QPalette* Qt6CTPlatformTheme::palette(QPlatformTheme::Palette) const
...

```

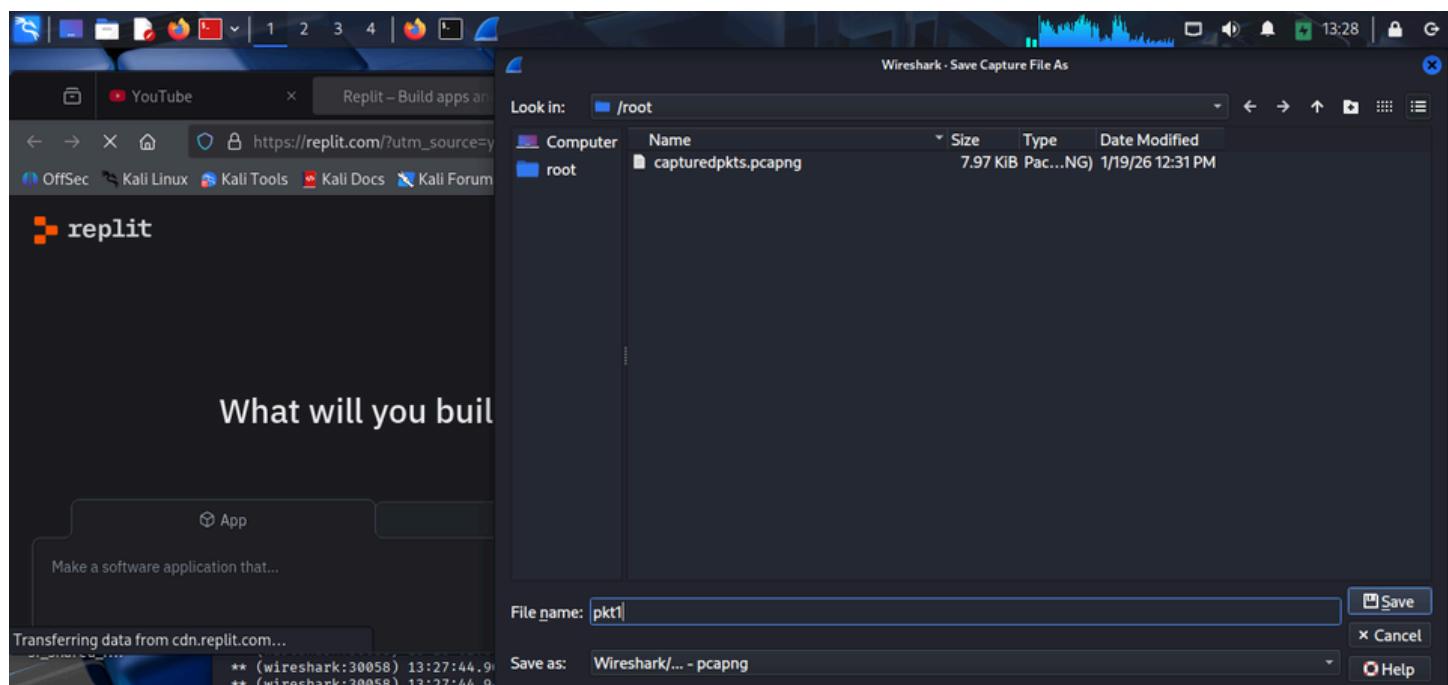

- Choose the required interface for capturing traffic. Double click to start the capture.

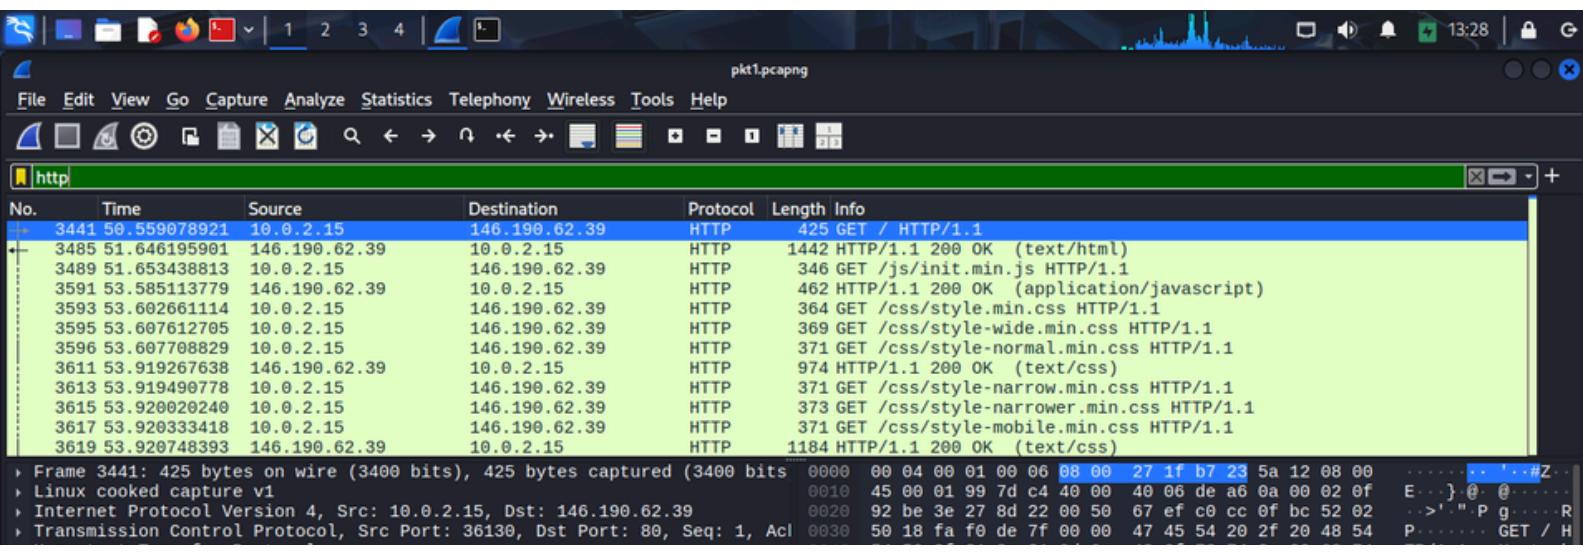

- Open firefox browser in your kali machine and search and go to different websites to capture different traffic which uses http, dns, tcp protocols.

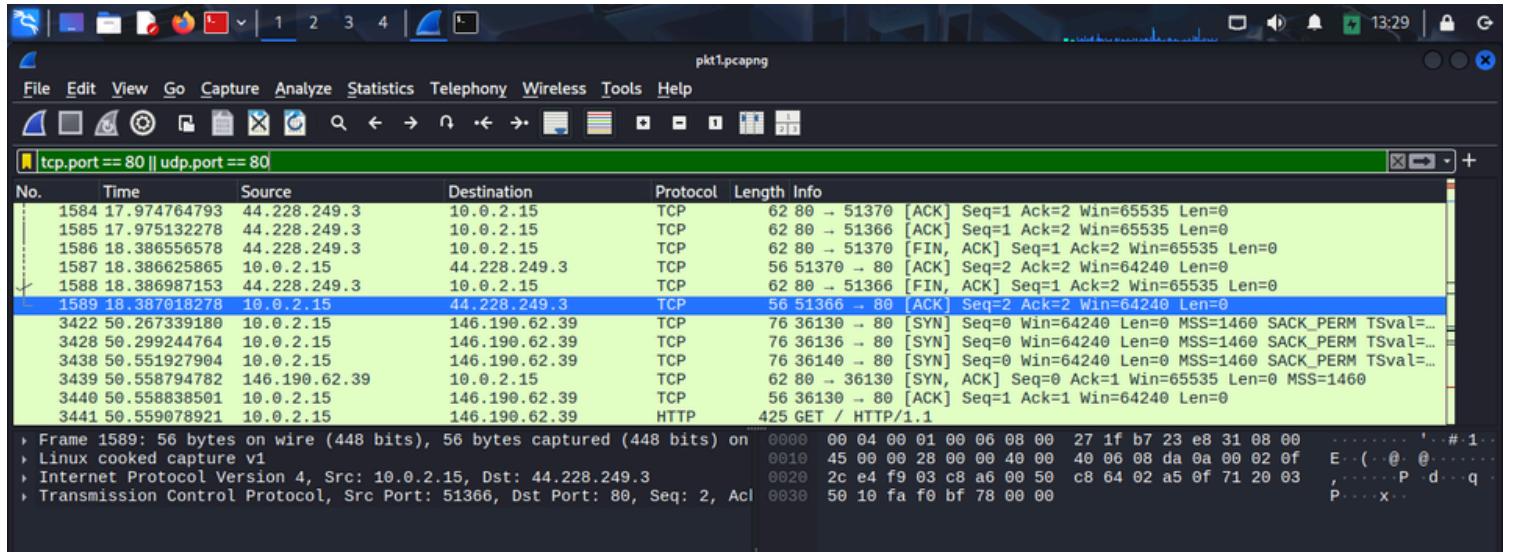

- Save the captured traffic in a .pcap file to save and analyse the network traffic.

- Filter it by applying display filter for filtering different traffic, e.g.- http, tcp, dns, etc.

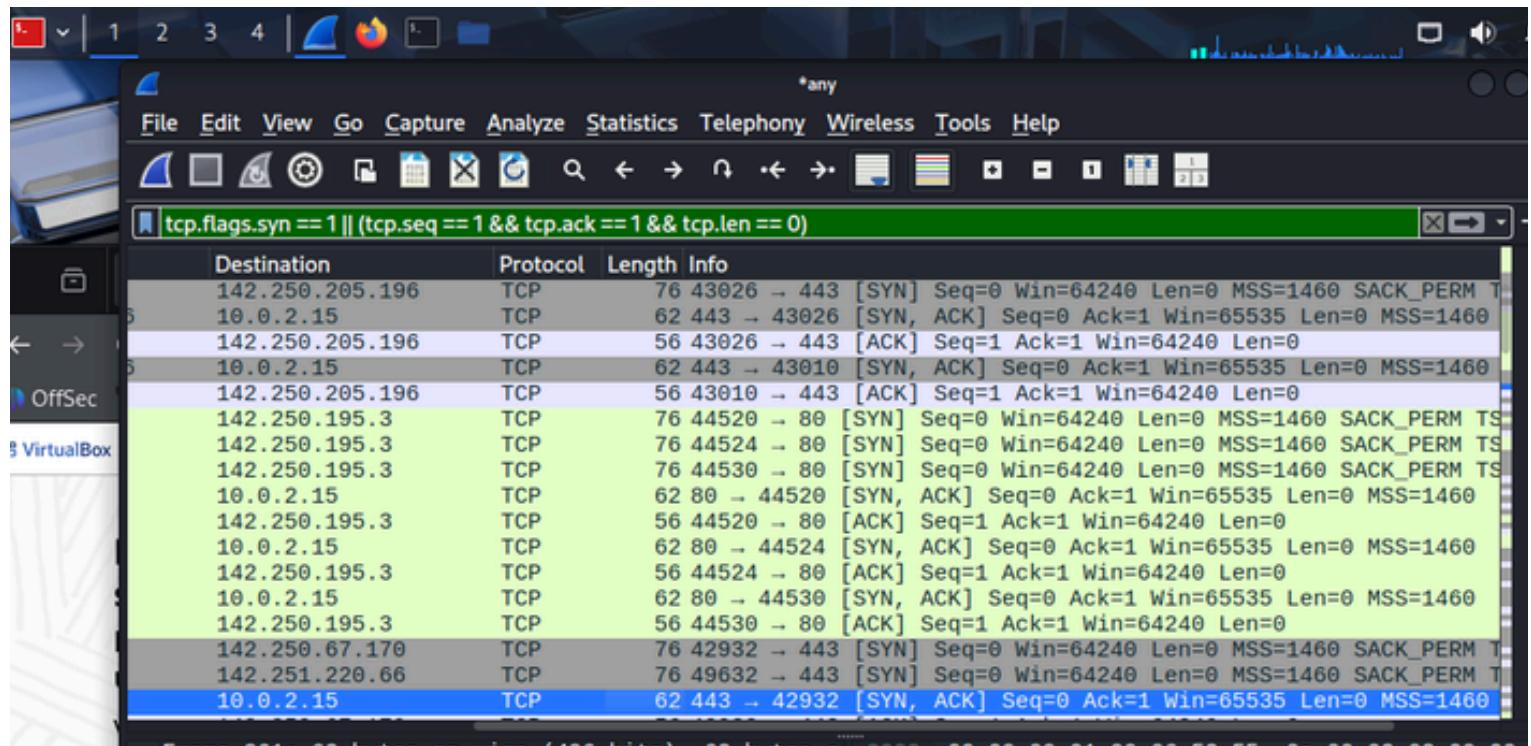

## Three-Way TCP Handshake

The **three way handshake**, also known as the **TCP handshake**, is a fundamental process in **networking** that establishes a reliable connection between a client and a server before data transmission begins. This handshake ensures that both devices are synchronized and ready for communication, providing the backbone for **TCP (Transmission Control Protocol)** reliability.

### Observing in wireshark

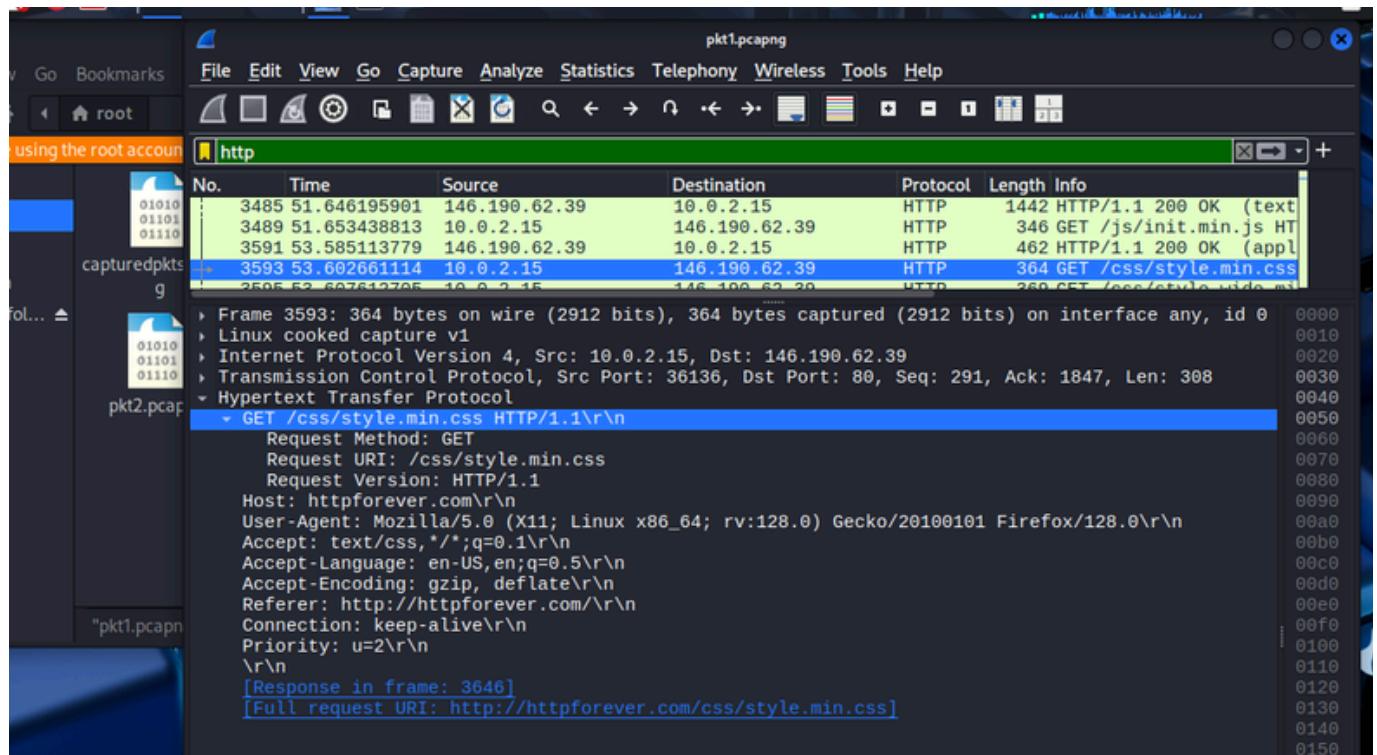

To see the "handshake" that establishes a connection:

1. Filter for `tcp.flags.syn == 1`.
2. Find a packet, right-click it, and select **Follow -> TCP Stream**.
3. Look for the sequence:
  - o **SYN** (Synchronize)
  - o **SYN, ACK** (Synchronize-Acknowledge)
  - o **ACK** (Acknowledge)

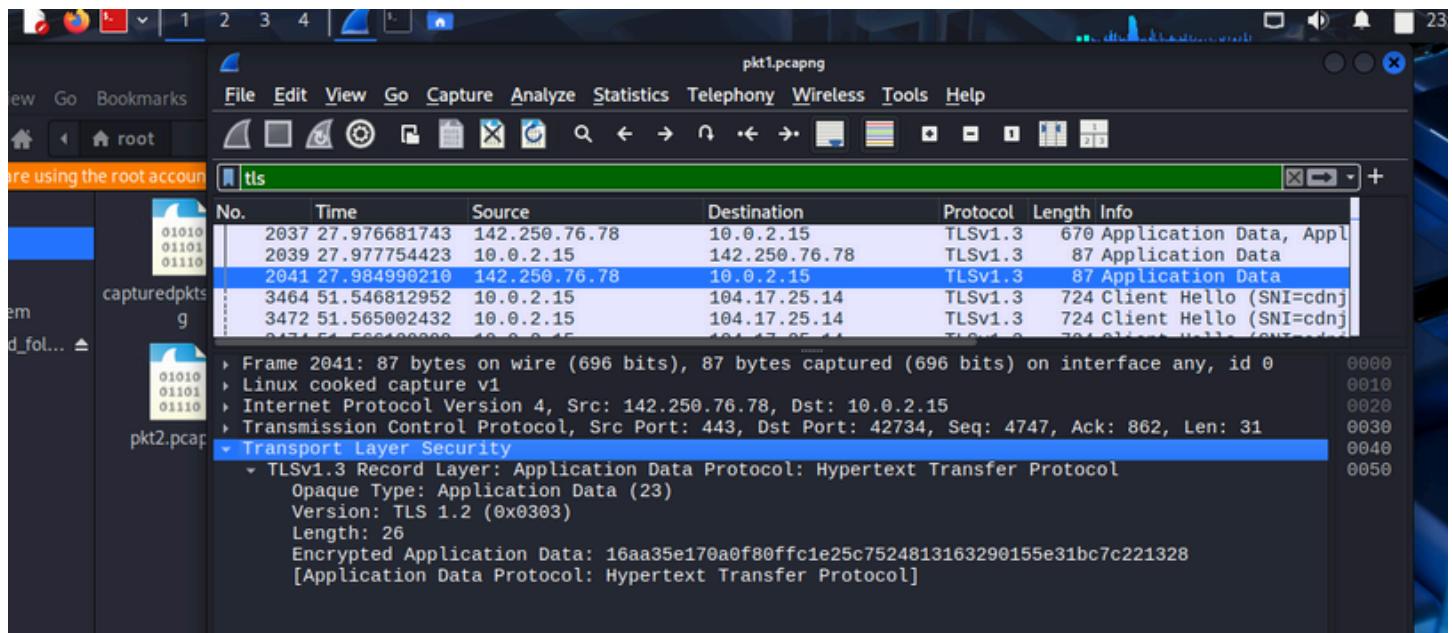

## Plain-Text vs. Encrypted Traffic

- **Plain-Text (HTTP):** Filter for http. Find a "GET" or "POST" request. Click into the "Packet Details" pane. You will likely be able to read HTML code, form data, or headers in clear text.

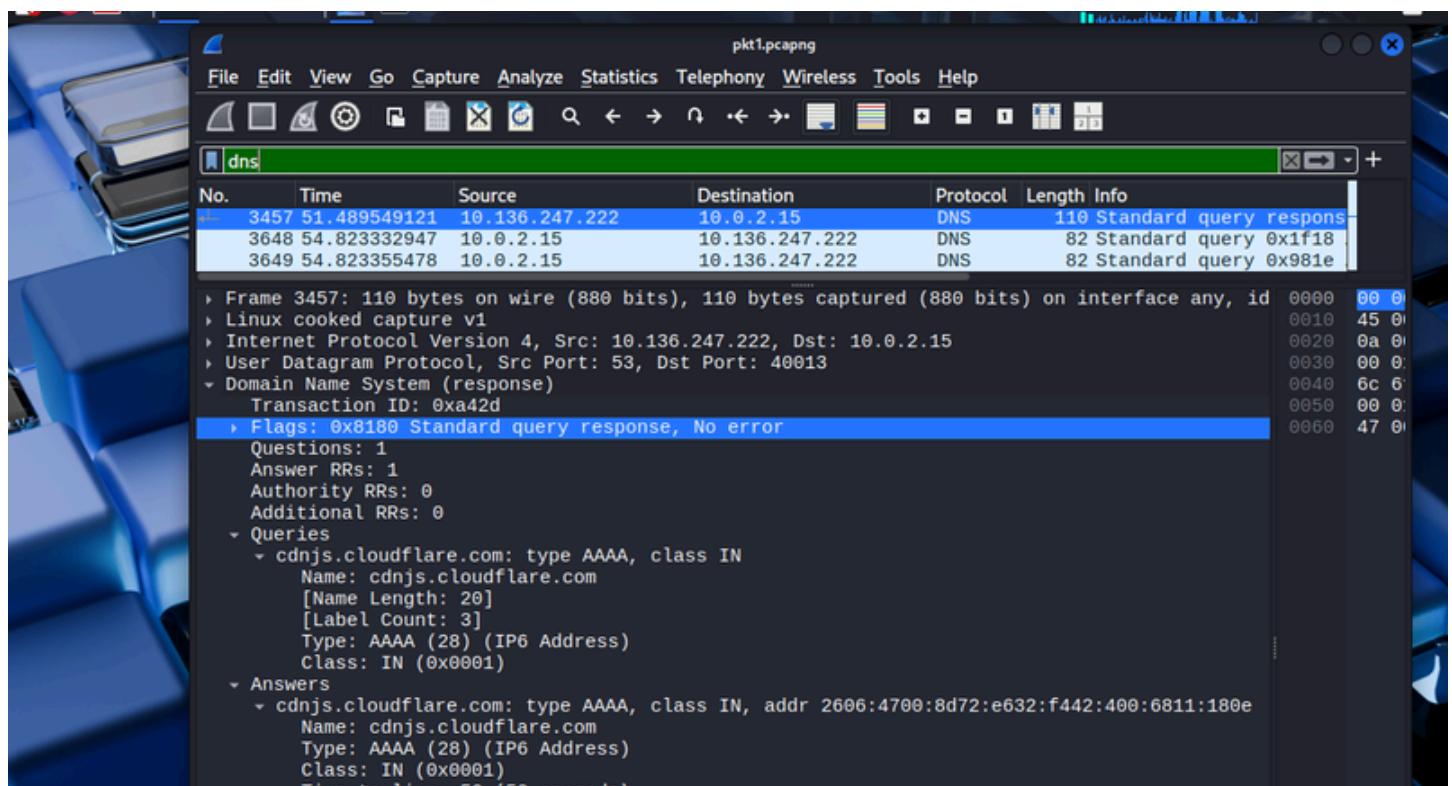

- **Encrypted (HTTPS/TLS):** Filter for tls. You will see "Application Data" packets. If you look at the raw data, it will look like random gibberish (hexadecimal), which is the encrypted payload.

## Analyze DNS Queries

1. Filter for dns.
2. Look for a "Standard query" (Your PC asking "Where is https://www.google.com/url?sa=E&source=gmail&q=google.com?") and a "Standard query response" (The server answering with an IP address).
3. Expand the **Queries** section in the packet details to see exactly what domain was requested.

## Analysis Report

**Project Overview** Captured live traffic on interface eth0 and interface any. Analysed DNS, HTTP, TLS, TCP.

**Protocol Observations** are listed above with screenshots I captured traffic in different files to analyse different type of traffic.

Analysed packet with HTTP protocol -found plain text headers. TLS traffic-contained encrypted headers/data.

Analysed DNS queries- Listed standard query and answers containing domain names in response.

Filtered for TCP- observed TCP 3 way handshake by observing sequence- SYN, SYN-ACK, ACK packages.

## Security Findings

- **Plain-text risk:** I observed that traffic to [Site Name] was unencrypted, meaning a hacker could see my data.
- **Encryption:** Most modern web traffic was hidden behind TLS 1.3, ensuring privacy.
